

Suction Cups

Sometimes we turn the foam carrier plate into a suction cup plate. The UniGripper Intelligent Vacuum functionality is still there, but each check valve has a suction cup instead of a hole in the suction foam. The reason for using suction cups is that in some environments, the wear on suction cups is lower than on suction foam. If the decrease in flexibility that suction cups gives instead of using a foam can be managed, the higher initial investment in suction cups can pay off in the long run.
